

# JavaScript test

This exercise is about displaying players' scores on a specific online Playing Game over time.

Please, proceed as follows:

- first, build a **web service** to retrieve data from [the provided URL](#), and display it in the different formats required by the different frontend features;
- second, build a **good looking HTML** page which will query the service and display:
  - ◆ a bar chart comparing the scores of the players over time
  - ◆ a note when clicking on a specific bar with the aggregated numbers
  - ◆ a URL on details view with direct access to the URL (not required but a plus)

Constraints: a lightweight solution is expected so, no charting library or JavaScript framework should be used for this test.

In case you have questions about the exercise, don't hesitate to contact me.

We'll be waiting for your answer for a week. Once this deadline is due, we'll no longer take your application into consideration.

Good luck.
